

CLAIMS

1. A silica-containing laminated structure comprising a transparent thermoplastic resin substrate and, laminated thereon, at least one porous silica layer having a refractive index of 1.22 or more and less than 1.30,
5 wherein said at least one porous silica layer is comprised of a plurality of moniliform silica strings, each comprising a plurality of primary silica particles which are linked in rosary form, and
10 wherein the pores of said at least one porous silica layer include pores (P), each of said pores (P) having a pore opening area which is larger than the average value of the respective maximum cross-sectional areas of said primary silica particles, wherein said pore opening areas of said pores (P) are measured with respect to the pore openings in the surface or cross-
15 section of said porous silica layer.
- 20 2. The silica-containing laminated structure according to claim 1, wherein said moniliform silica strings have an average length of from 30 to 200 nm in terms of the average value as measured by the dynamic light scattering method.

3. The silica-containing laminated structure according to claim 1 or 2, wherein the amount of silicon atoms present in said moniliform silica strings is 15 % or more, based on the total number of silicon atoms present in said at least one porous silica layer.

4. The silica-containing laminated structure according to any one of claims 1 to 3, wherein a part or all of said pores (P) have their respective pore opening areas (a_1), each of said pore opening areas (a_1) being independently at least 3σ larger than the average value (a_2) of the respective maximum cross-sectional areas of said primary silica particles, wherein said pore opening areas (a_1) are measured with respect to the pore openings in the surface or cross-section of said porous silica layer, and wherein σ represents the standard deviation of the measured values of the maximum cross-sectional areas of said primary silica particles, and wherein the total ($S_{(a_2+3\sigma)}$) of said pore opening areas (a_1) of said pores (P) and the total (S) of pore opening areas of all pores of said porous silica layer as measured with respect to the pore openings in the surface or cross-section of said porous silica layer satisfy the following formula (1):

$$(S_{(a_2+3\sigma)})/(S) \geq 0.5 \quad (1).$$

5. The silica-containing laminated structure according to any one of claims 1 to 4, wherein said transparent thermoplastic resin substrate has a pencil hardness of from 1H to 8H.

6. The silica-containing laminated structure according to any one of claims 1 to 5, which further comprises a hard coat layer having a water contact angle of 85° or less between said transparent thermoplastic resin substrate and said porous silica layer.

7. A coating composition for use in forming on a substrate a porous silica layer having a low refractivity, which comprises a product obtained by a method comprising:

mixing a dispersion of moniliform silica strings with a hydrolyzable group-containing silane to obtain a mixture, wherein each of said moniliform silica strings comprises a plurality of primary silica particles which are linked in rosary form, and

subjecting the obtained mixture to hydrolysis and dehydration-condensation.

8. The coating composition according to claim 7,
wherein said moniliform silica strings have an average
length of from 30 to 200 nm in terms of the average
value as measured by the dynamic light scattering
method.

5

9. The coating composition according to claim 7 or 8,
wherein the molar ratio of said hydrolyzable group
-containing silane to the silicon atoms present in said
moniliform silica strings is from 0.005 to 1.0.

10

10. The coating composition according to any one of
claims 7 to 9, which further comprises at least one al-
kaline earth metal salt.

15

11. The coating composition according to claim 10,
wherein the molar ratio of said at least one alkaline
earth metal salt to the silicon atoms present in said
moniliform silica strings is from 0.001 to 0.1.

20

12. The coating composition according to any one of
claims 7 to 11, which further comprises an acid in a
concentration of 0.0008 mol/liter or more, and which
has a water content of more than 1.5 parts by weight,
25 per part by weight of said moniliform silica strings.

25

13. An antireflection film comprising at least one porous silica layer having a low refractivity, which is formed by using the coating composition of any one of 5 claims 7 to 12.

14. An antireflection film comprising the silica-containing laminated structure of any one of claims 1 to 6, said silica-containing laminated structure comprising a transparent thermoplastic resin substrate and, 10 laminated thereon, at least one porous silica layer having a refractive index of 1.22 or more and less than 1.30,

15 wherein said at least one porous silica layer contained in said silica-containing laminated structure is formed by using the coating composition of claims 7 to 12.
